                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens (Human).
```

```
SUBCELLULAR LOCATION: EXTRACELLULAR.
TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN LIVER, LUNG,
BRAIN, HEART, KIDNEY, STOMACH, INTESTINE, SKIN, CALVARIA AND
PLACENTA. NOT DETECTED IN SPLEBN.
BEVELOPMENTAL STAGE: IN SPLEBN.
DAY 7. AT DAY 11, EXPRESSION DECREASES AND THEN INCREASES FROM DAY
15 TO DAY 17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mizuno A., Murakami A., Nakagawa N., Yasuda H., Tsuda E., Morinaga T.,

-i- FUNCTION: MAY REGULATE BONE RESORPTION BY BLOCKING TERMINAL STAGE OF OSTEOCLAST DIFFERENTIATION AND ALLOWING ACCUMILATION OF NEWLY SYNTHESIZED BONE AND CARTICAGE. MAY INHIBIT IN VITRO OSTEOCLASTOGENESIS BY INTERUPTING CELL-TO-CELL SIGNALING BETWEEN STROMAL CELLS AND OSTEOCLAST PROCEDINGS.
-i- SUBUNIT: HOMODIMER (MAJOR FORM) AND MONOMER (MINOR FORM).

Total number of hits satisfying chosen parameters: 197339

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Maximum DB seq length: 2000000000 Post-processing: Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of human tumour necrosis factor receptor-like protein TRI1, a novel 25 kDa protein which shows 58.6% identity to murine glucocorticoid induced tumour necrosis factor receptor family related gene. The sequence was deduced from a cDNA clone (see AAA50304) discovered in a T-helper cell library.

TRII activated NF-kappaB through a TRAP2-mediated mechanism.

Expression is activation-inducible. The TRI1 ligand is constitutively expressed in an endothelial cell line. This suggests that TRI1 and its ligand may be involved in activated T-cell trafficking. The invention provides TRI1, TRISVI and TRIISV2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an

protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen specific proliferation and cytckine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoletic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                     Human 312C2 T cell protein; thymus cell; spleen cell; T cell;

```
The present sequence represents human PRO364, a novel member of the tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO.

Escherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-x, 26-241 (i.e. the resemble protein) and 26 x of the present sequence, where x is any one of amino acid respdies 157-167 of PRO364. PRO364 polypeptides are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammallan cells (claimed). Chimeric molecules comprising a PRO364 polypeptide fused to a heterologous sequence such as epitope tag or immunoglobulin Fc region are also claimed. PRO364 can be used in sasays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or also be combined with an agent that is cytotoxic, chemotherapeutic
PRO364; tumour necrosis factor receptor; human; apoptosis; inflammation; antiinflammatory; NF-KB activation; autoimmune disease; therapy.

                                                      curvival. They can be used for treating immune deficiency disorders, beginning a syndrome, HIV infection, severe combined immunodeficiency (SCID), wiskert-Aldrich disorder, blood coaquiation disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, haemolytic anaemia. Theumatoid arthrilis, Goodpastures syndrome, Grave's disease, multiple sclerosis, mysthenta gravis, Stiff-Man syndrome, gystemic lupus erythematosus, Guillain-Barre syndrome, insulin dependent disease, multiple sclerosis, mysthenta gravis, Stiff-Man syndrome, systemic lupus erythematosus, Guillain-Barre syndrome, insulin dependent disease, not autoimmune inflammatory eye disease, anaphylaxis, hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cycokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections. They can also be used to repair, replace, or protect tissue damaged by congenital surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-brager syndrome). The products can also be used for detection, diagnosis and prognosis.
                                                                                                                                                                                                                                                              This is the amino acid sequence of the human tumour necrosis factor receptor-like protein (TR11 receptor). The invention relates to TR11 and two splice variants TR11SV1 and TR11SV2. The nucleotide sequences were determined by sequencing cloned cDNAs AA237765-237766. The TR11 receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR). TR11, TR11SV1 and TR11SV2 polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for agonists/Antagonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell
                                                                                                                                                                           New tumour necrosis factor receptor-like polypeptides used to, e.g.
                                                                                                                                                                                                                                Claim 14; Fig 1; 167pp; English

The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antiqen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                               Human 312C2 T cell protein; thymus cell; spleen cell; T cell;
antigen-specific T cell proliferation; cytokine production by T-cell;
apoptosis; cancer; haematopoietic cells; lymphoid cell;
autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             67 CSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTFSGGHEG 126

ö
diseases including graft rejection and graft-versus-host-disease. AAC58397 to AAC58578 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAC58579 to AAC58642 and AAB33414 to AAB3347 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid

                                                                  Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                                                                                                                                                     The present invention relates to methods for stimulating or inhibiting angiogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO238, PRO340, PRO844, PRO846, PRO846, PRO815, PRO205, PRO317, PRO877, PRO879, PRO885 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or angiogenic disorders. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; immune related disease; diagnosis; antiinflammatory; cardiant; dermatological; antiarthritic; antirheumatic; immunosuppressive; haemostatic; antithyroid; antidabetic; noctropic; neuroprotective; antianaemic; hepatotropic; virucide; antipsoriatic; antiallergic; antianatic; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; spondyloarthropathy; systemic sclerosis; sarcoidosis; idiopathic inflammatory myopathy; Systemic sclerosis; sarcoidosis; systemic vasculitis; autoimmune haemolytic anaemia; diabetes mellitus; autoimmune thrombocytopaenia; immune-mediated renal disease; demyelinating disease; hepatobilitary disease; Whipple's disease; inflammatory bowel disease; gluten-sensitive enteropathy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 YPGEECCSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTF 120
